

```
#include<iostream>
using namespace std;
void main()
{
    //string name = "Suleiman";
    string name;
    cout << "enter your name PLZ\n ";
    cin >> name;
    cout << "Hello " << name << endl;
}
```

```
#include<iostream>
using namespace std;
void main()
{
    int x; cout << "enter the first Nu: ";
    cin >> x;
    int y; cout << "enter the second Nu: ";
    cin >> y;

    cout << x << " + " << y << " = " << x + y << endl;
}
```

مساحة ومحيط المستطيل

```
#include<iostream>
using namespace std;
void main()
{ //width length - perimeter- area
    int width; cout << "enter width: ";
    cin >> width;
    int length; cout << "enter length: ";
    cin >> length;

    cout << "Area is " << width * length << endl;
    cout << "Perimeter is " << (width + length)*2 << endl;
}
```

محيط ومساحة الدائرة

```
#include<iostream>
using namespace std;
void main()
{
    cout << "enter the Radius: ";
    double r; cin >> r;
    cout << "Area is " << 22 / 7 * r * r << endl;
    cout << "Circumference is " << 22 / 7 * r * 2 << endl;
}
```

برنامج قراءة عدد وطباعة فيما اذا كان العدد فردي ام زوجي؟

```
#include<iostream>
using namespace std;
void main()
{
    cout << "enter the Number: ";
    int N; cin >> N;
    if (N % 2 == 0)
        cout << "Even" << endl;
    else
        cout << "Odd" << endl;
}
```

Another solution:

```
#include<iostream>
using namespace std;
void main()
{
    cout << "enter the Number: ";
    int N; cin >> N;
    cout << (N % 2 == 0 ? "Even" : "Odd") << endl;
}
```

برنامج يقوم بقراءة عددين وطباعة العدد الأكبر

```
#include<iostream>
using namespace std;
void main()
{
    cout << "enter the first Number: ";
    int x; cin >> x;
    cout << "enter the second Number: ";
    int y; cin >> y;
    if (x > y)
    {
        cout << x << endl;
    }
    else if(x<y)
        cout << y << endl;
    else
        cout << y<<" = "<<x << endl;
}
```

قراءة 3 اعداد وطباعة العدد الأكبر

```
#include<iostream>
using namespace std;
void main()
{
    cout << "enter the first Number: ";
    int x; cin >> x;
    cout << "enter the second Number: ";
```

```

    int y; cin >> y;
    cout << "enter the third Number: ";
    int z; cin >> z;
    if (x > y && x>z)
    {
        cout << x << endl;
    }
    else if(y>z)
        cout << y << endl;
    else
        cout << z << endl;
}

```

```

#include<iostream>
using namespace std;
void main()
{
    cout << "enter the first Number: ";
    int x; cin >> x;
    cout << "enter the second Number: ";
    int y; cin >> y;
    cout << "enter the third Number: ";
    int z; cin >> z;    int mx;
    if (x > y&& x > z)
        mx = x;
    else if (y > z)
        mx = y;
    else
        mx = z;

    cout << mx << endl;
}

```
